Azure Local and Windows Server

Azure Local

Windows Server

✓ Exciting roadmap of new HCI focused releases

Innovation focused on being the
best virtualization host

Future of Hyper-V virtualization,
software-defined storage and networking

Run apps inside Windows or Linux virtual machines

Runs on **your hardware**

✓ Exciting roadmap of new releases

Innovation focused on being the
best guest and traditional server

All other Windows Server roles,
like IIS, File Services, DNS, DHCP, AD/DS

Runtime for Windows apps like SQL Server

Runs **anywhere**

Is Hyper-V Dead?

How Secure is Hyper-V, Really?

Opinion

Sep 3, 2008 • 3 mins

Virtualization

Given all the talk about Hyper-V, I have some security questions, but so far, not many good answers.

Hyper-V's current security is dependent upon the security of Windows 2008 Server. Sounds like a hosted solution to me, even though Hyper-V is a type 1 hypervisor—which is designed to run on bare metal and therefore be completely independent of the operating system itself.

So why does Hyper-V depend on Windows 2008 Server security? What zero-day attacks will cause heart-ache for all adopters? Can they be prevented?

And which boots first? If it is Hyper-V, then 2008 should run within a VM, but does it? If Windows 2008 Server crashes or is forced to crash by something malicious, will all the VMs running upon it also come tumbling down?

True or False - HYPER-V to be discontinued in 2029 ?

Hi folks

I saw this on the TestGorilla site :

START OF QUOTE :

What is Hyper V?

Hyper V is a virtualization machine developed by Microsoft. It's a type 1 hypervisor, meaning that it runs directly on the physical hardware, and that's why it takes the place of the host OS. In contrast to Hyper V, VirtualBox and VMware's Workstation both operate on a type 2 hypervisor, as a computer program – they're not able to host hardware and resources as they need to go through operating systems.

Even though the virtualization platform was popular for Windows users, Microsoft is discontinuing Hyper V as of 2029. There still hasn't been an announcement about any replacement for the program.

END OF QUOTE:

Is this true or just vapourware -- if true it seems not a lot of point in allocating time and resources for using a product destined to be discontinued in a few years time.
I know many big companies are moving over (or have already moved over) to containerisation and Kubernetes instead of running full blown VM's -- but there's still a huge market for VM's for individuals and smaller commercial users.

2029 might still seem a bit of a way off but this probably means (if true) that Ms is already

Is Microsoft Hyper-V Dead?

November 20, 2023 by Brandon Lee

Microsoft Hyper-V is Microsoft's answer to the world of virtualization. In my opinion, Hyper-V has always been behind the curve that VMware has set in terms of features and capabilities. VMware has an edge in most areas. Hyper-V is a viable option for those heavily invested in the Microsoft ecosystem and who want to take advantage of virtualization as part of Windows Server and provide VMs to users. However, while Microsoft has announced a few new features here and there, Hyper-V seems to be a stagnant product, leading many to wonder, is Hyper-V dead? In this article, we will look at current Hyper-V options and the future for customers.

There are NO plans to deprecate Hyper-V Technology. Period. None. Zero. Nunca. Zilch. In fact, quite the opposite. Hyper-V is a strategic asset. Microsoft literally uses Hyper-V EVERYWHERE.

The only thing that was discontinued was the **FREE** Microsoft Hyper-V Server product because we simply don't have the time and resources to keep producing the free version. That's it. That's the only thing that was deprecated. Hyper-V is used in Azure, Azure Stack, Windows Server, Windows, Xbox, etc. *is under serious development*. In fact, Windows Server vNext will introduce a whole host of new Hyper-V innovation some which is unavailable on any other hypervisor in the industry. (No, I can't be more specific at this time. See you at Ionite!)

No, Hyper-V Is Not Dead

Eric Siron January 26, 2024

(Somewhat) jokingly, I have long said that a certain company famous for virtualization has set a goal of bankrupting all its customers as its victory condition. That company was recently purchased (again), and the new owners promptly set about trying to prove me correct with massive price increases. As part of their campaign to do anything except set reasonable pricing, they have begun telling customers that Hyper-V is dead. At best, they're wrong. At worst, they're lying. Hyper-V is not dead. Hyper-V is not dying. Hyper-V is an integral part of Microsoft's product lineup.

[citationic]

The Proof of Hyper-V's Importance

Update: Jeff Woolsey, Principal PM at Microsoft, released a [statement on the bright future of Hyper-V](#).

At Microsoft's annual Ignite conference in November of 2023, Jeff Woolsey and Elden Christensen led a [session on Windows Server \(vNext\)](#). Presumably, this will appear as Windows Server 2025, but it has yet to receive an official name. The deck for the presentation has more slides for upcoming Hyper-V enhancements than any other category. Some highlights:

- Enhanced GPU support with GPU-P that addresses long-standing problems
- Dynamic processor capabilities for migration in mixed-CPU clusters
- Hot-add and hot-remove of virtual NICs

As more concrete proof, consider Hyper-V's increasing pervasiveness. It fuels Azure. Security components, even on desktop Windows, rely on Hyper-V technology (for example, [Microsoft Defender Application Guard](#)). WSL version 2, Windows Sandbox, and Hyper-V containers all depend on some or all of Hyper-V. With modern Windows, you would have a difficult time avoiding Hyper-V.

The FUD Around Hyper-V

Most of the FUD around Hyper-V consists of the same nonsense that has circulated since its introduction. Basic research can debunk all that. I will leave it to a future article to address them comprehensively. In this one, I want to look at the more recent and immediate misinformation.

The End of Hyper-V Server

Microsoft has a problem with naming things and should seek therapy. "Hyper-V Server" refers not to the Hyper-V technology or its place in the server world. It means a specific SKU that ran a highly trimmed version of Windows Server that did not have an activation mechanism. Yes, that SKU met its end in the 2019

Where can we
find Hyper-V?

Where can we find Hyper-V

Windows 11

For running VM's on your computer.
Windows Sandbox
Defender Application Guard

Windows Server

Traditional server virtualization

Azure Local

Azure Hybrid on-prem with management from Azure

Azure

Yes Azure runs on Hyper-V

Xbox

Your games would not work without Hyper-V on Xbox

Others

Windows Subsystems for Linux
Docker on Windows
Windows Sandbox
Defender Application Guard

So where is it
being used
